The background consists of several overlapping, semi-transparent geometric shapes in shades of green and teal. A large teal shape is in the center, with darker teal and lighter green shapes layered on top and bottom, creating a sense of depth and movement.

Number of speakers of a language is the estimated total of primary and secondary speakers, and is in many cases a very rough estimation (based on the page on the English Wikipedia about that language)
 Regions are parts of the world where the language is spoken in substantial amounts (compared to total number of speakers). Regions where a language gained presence only by a recent diaspora are generally not included.
 Region codes: **AF**:Africa, **AS**:Asia, **EU**:Europe, **NA**:North America, **OC**:Oceania, **SA**:South America, **W**:World Wide, **CL**:Constructed Language

Localization level: The localization score expresses in a number between 0 and 100 how complete the localization for a given language is on [translatewiki.net](#). It is a weighted average of the completeness levels for different categories of messages. For details see the [script](#).

Percentages: percentage anonymous edits is calculated as percentage of manual edits (= total edits - bot edits). See below for [explanation of other percentages](#).

Gnuplot is a portable command-line driven graphing utility for Linux, OS/2, MS Windows, OSX, VMS, and many other platforms. The source code is copyrighted but freely distributed (i.e., you don't have to pay for it). It was originally created to allow scientists and students to visualize mathematical functions and data interactively, but has grown to support many non-interactive uses such as web scripting. It is also used as a plotting engine by third-party applications like Octave. Gnuplot has been supported and under active development since 1986.

Gnuplot supports many different types of 2D and 3D plots

Here is a [Gallery of demos](#).

Gnuplot supports many different types of output

interactive screen display;	cross-platform (Qt, wxWidgets, x11) or system-specific (MS Windows, OS/2)
direct output to file;	postscript (including eps), pdf, png, gif, jpeg, LaTeX, metafont, emf, svg, ...
mouseable web display formats;	HTML5, svg

Help

You can export the text and editing history of a particular page or set of pages wrapped in XML. This may then be imported into another wiki running MediaWiki using [Special:Import](#), if it is enabled. It may also be scanned by [AutoWikiBrowser's](#) database scanner.

To export article pages, enter the titles in the text box below, one title per line, and select whether you want the current version as well as all old versions, with the page history lines, or just the current version with the info about the last edit. Other parameters of this interface, not available via this web form, are explained in [Parameters to Special:Export](#).

To export the current revision of an article, a link such as [Special:Export/Train](#) can be used for the article [Train](#).

Full history exports are limited to 1000 revisions.
